Dear Mercury Design Foundations Team,

I am excited to apply for the Frontend Engineer, Design Systems position at Mercury. I am drawn to this role because I enjoy the point where software engineering and design meet: building interfaces that work reliably, look intentional, and feel natural to use.

I have worked as a one-person team designing, developing, and launching websites and software from the ground up. That has meant doing much more than writing code. I have spoken with customers, turned their needs into product decisions, designed the interfaces, built the frontend, tested the experience, and carried the work through launch. I have also sold software, which taught me how strongly usability, visual quality, and trust influence whether someone sees value in a product.

A project I am especially proud of is Deaf Shark Coffee, a complete customer-facing website I designed and built for a local coffee shop. I created an experience that communicates the brand while helping customers explore the menu, learn the shop's story, find essential information, and place an order. I have also built Adzio, Days Ice Cream, and TrainingAIO. Across these projects, I made the design and engineering decisions myself, creating responsive interfaces and reusable components with React, TypeScript, Next.js, HTML, CSS, and Tailwind CSS.

Building several products independently has made me think in systems. I look for patterns that can be reused instead of solving the same interface problem repeatedly. I consider how typography, spacing, color, components, responsive behavior, and accessibility work together to create a consistent experience. It has also taught me ownership. When something is unclear or does not work, I investigate it, improve it, and follow it through.

I regularly use AI-assisted development tools to explore solutions and move faster, but I do not treat generated code as finished work. I review it, test it in context, and refine it so that it fits the product and works as intended. Mercury's interest in design systems that support both people and AI agents is one of the most exciting parts of this opportunity for me.

I would bring Mercury practical experience building real products, an entrepreneurial perspective from selling software, and genuine care for frontend craft. I would be excited to learn from the Design Foundations team while contributing the resourcefulness and ownership I have developed from building products independently.

Thank you for considering my application. I would welcome the opportunity to discuss my work and how I could contribute to Mercury's design system.

Sincerely,

Vincent S. Pronel
