Dear Tradeweb Human Resources Team,

I am excited to apply for the Summer 2027 Human Resources Data and Analytics Internship at Tradeweb. What interests me about this position is the opportunity to work where people, data, and technology meet. I enjoy taking information that may initially feel complicated, identifying what matters, and turning it into something people can understand and use to make a decision.

I am a computer science student at Kean University with experience using Python, SQL, databases, and spreadsheets to organize and work with data. As a Code Samurai peer tutor, I lead two weekly technical sessions covering database systems and data structures and algorithms. That role requires me to recognize where someone is struggling, break a complex problem into understandable parts, and communicate the same idea to people with different levels of technical experience. Those are skills I would bring to reporting work and conversations with both HR and technology teams.

My undergraduate research combines HCI, AI, and data-driven evaluation. I am studying how different GPT-based coaching configurations affect users of a debate practice application. The project has given me experience defining questions, comparing outcomes, identifying patterns, and communicating findings. It has also made me think carefully about how technology and AI can improve a process without sacrificing accuracy, context, or human judgment, which directly connects with Tradeweb's interest in improving HR reporting and operational efficiency through technology.

Outside the classroom, I design and build software and websites for real clients. Working independently has taught me to manage projects from an unclear request through a finished product, pay attention to details, and create tools around the needs of the people using them. My earlier experience supporting technology across a school district also taught me to work professionally with user accounts, permissions, and information that had to be handled responsibly.

I am especially interested in learning how Tradeweb uses dashboards and workforce metrics to understand talent acquisition, engagement, retention, performance, and development. I would be excited to support the collection and analysis of HR data, improve reporting workflows, and help translate trends into useful insights for workforce planning. Tradeweb's combination of hands-on projects, mentorship, and exposure to a global financial technology business makes this an opportunity where I believe I could contribute while developing into a stronger analyst.

Thank you for considering my application. I would welcome the opportunity to discuss how my analytical foundation, communication experience, and interest in using technology to improve decisions could contribute to Tradeweb's Human Resources team.

Sincerely,

Vincent S. Pronel
